

Amendments to the Abstract:

Please replace Abstract with the amended Abstract as follows:

A light emitting diode according to the present invention comprises including an element substrate, a light emitting element mounted on said element substrate, a sealing body which transmits and emits light from the light emitting element and which seals said the light emitting element, and a light shielding means member to form light emitting parts for directing light from the sealing body in two dimensional directions which are formed from a combination of either two axes of three dimensional axes X, Y and Z. The, has the light shielding means causes member configured to cause one portion of the light emitting parts to light-emit light and the other of the light emitting parts to shield light-shield.
